

OPTIMA

An AI-powered site selection platform

SAUDI ARABIA · AI DATA CENTER SITE INTELLIGENCE

Razan Alateek

Founder & Developer, Optima

- CIS fresh graduate, May 2026
- Motivated by Saudi Arabia's rapid AI and data center infrastructure growth under Vision 2030
- Building Optima to turn scattered regulatory, technical, and environmental data into clear, fast investment decisions

Edit the first bullet with your real background before presenting.

The Problem

Building an AI data center in Saudi Arabia means clearing a long, fragmented pipeline before ground is ever broken.

Investors face months of coordination across multiple government agencies and scattered data sources — power availability, water access, connectivity, land, climate, and zoning are each held by a different party, with no single source showing which sites are actually viable.

Why We Built Optima

One AI-powered platform

Optima centralizes scattered regulatory, technical, infrastructure, and environmental data into one AI-powered platform for AI data center site selection in Saudi Arabia.

It analyzes and compares potential locations across the Kingdom to help investors identify the most suitable sites — and make faster, more informed investment decisions.

How We Evaluate Every Site

Six dimensions, scored and compared across every candidate location.

Power

Substation proximity, grid capacity, reliability

Water

Availability, reliability, sustainability, drought risk

Connectivity

Fiber backbone access, redundancy, latency

Climate

Temperature, cooling efficiency impact

Land

Price, parcel size, topography, flood risk

Regulations

Zoning, SEZ status, permitting speed

Let's take a look
